## **Implementation of Bubble Sort**

**Aim:** To write a C-program to implement Bubble Sort.

### **Bubble Sort:**

**Bubble sort**, sometimes referred to as **sinking sort**, is a simple sorting algorithm that repeatedly steps through the list, compares adjacent elements and swaps them if they are in the wrong order. The pass through the list is repeated until the list is sorted.

### **Implementing Bubble Sort Algorithm**

The steps involved in bubble sort(for sorting a given array in ascending order):

1. Starting with the first element(index = 0), compare the current element with the next element of the array.
2. If the current element is greater than the next element of the array, swap them.
3. If the current element is less than the next element, move to the next element. **Repeat Step 1.**

### **Program**

```
/*This program demonstrate Bubble Sort */
/* Bubble sort code */

#include <stdio.h>

int main()
{
    int array[100], n, c, d, swap;

    printf("Enter number of elements\n");
    scanf("%d", &n);

    printf("Enter %d integers\n", n);

    for (c = 0; c < n; c++)
```

```
scanf("%d", &array[c]);
//bubble sort logic
for (c = 0 ; c < ( n - 1 ); c++)
{
    for (d = 0 ; d < n - c - 1; d++)
    {
        if (array[d] > array[d+1]) /* For decreasing order use < */
        {
            swap      = array[d];
            array[d]   = array[d+1];
            array[d+1] = swap;
        }
    }
}

printf("Sorted list in ascending order:\n");

for ( c = 0 ; c < n ; c++ )
    printf("%d\n", array[c]);

return 0;
}
```

**Worst and Average Case Time Complexity:**  $O(n*n)$ . Worst case occurs when array is reverse sorted.

**Best Case Time Complexity:**  $O(n)$ . Best case occurs when array is already sorted.

**Space Complexity:**  $O(n)$ .

**Auxiliary Space:**  $O(1)$

**Sorting In Place:** Yes

**Stable:** Yes
